

HCN/Ih gating from the current Ih.mod mechanism

Steady-state open probability

Activation time constant

Ih.mod parameters:

$m\alpha = 0.001 * 6.43 * (v + 154.9) / (\exp((v + 154.9) / 11.9) - 1)$

$m\beta = 0.001 * 193 * \exp(v / 33.1)$

$P_{open} = m_{inf} = m\alpha / (m\alpha + m\beta)$

$m\tau = 1 / (m\alpha + m\beta)$

Current resonance scripts set ehcn=-45 mV and gIhbar by location; these scale current/conductance, not Popen.
